**What is the Application Identity Mapping (AIM) stage currently in effect for your various RACF databases?**

Responses	Count	Percent %
Stage 0 (AIM not implemented)	5	11.1%
Stage 1 (AIM alias index built but not used; UNIXMAP profiles still being used)	0	0%
Stage 2 (AIM alias index in use; UNIXMAP profiles maintained but not used)	0	0%
Stage 3 (AIM alias index fully implemented; UNIXMAP profiles no longer maintained or used)	40	88.9%
Total	**45**	**100%**

Reasons for not fully implementing AIM:
- Have not needed to use any RACF features that require a higher, non-zero AIM level.
- No one in the organization cares about mainframe security except me.
